PURPOSE

NexusTek's Business Requirements Analysis combines the experience of professional consultants with a proven methodology to effectively analyze the business requirements, workflows and processes within your organization.

The goal of each analysis is to demonstrate to you how current business processes affect the overall organization, chart strengths and weaknesses, and identify ways to fix problem areas.

A NexusTek Business Requirements Analysis maximizes your organization's potential and clarifies requirements critical to choosing the right solution.

PROCESS

Current: The first step in the Business Requirements Analysis is to determine how your organizational processes function "as is". We will review the processes and systems as they are currently in operation and document the current work and data flow.

Goal: The second stage of the Business Requirements Analysis is to create a "to be" scenario in which our consultants identify areas of opportunity and suggest what improvements would profit the business. The "to be" deliverable within the Business Requirements Analysis document will contain recommended changes to the existing processes to better meet the goals uncovered by the "as is" documentation, and highlight return on investment.

Gap Analysis: The final stage of the Business Requirements Analysis is to examine both the "as is" and the "to be" in order to document the requirements to select the best possible solution. The Gap Analysis is geared towards determining the correct level of functionality and flexibility an organization needs. The Gap Analysis will assign a priority rating to help you determine which improvements are more pressing and which can be phased in at a later time.

Once the Business Requirements Analysis document is completed, a review meeting is scheduled for us to present your organization with a written record of our findings. The Business Requirements Analysis Documentation will identify problem areas, projected goals for the organization, and how to achieve the desired state.

Driving Excellence

Quick, but in depth interviews are conducted to determine what currently works, what needs improvement and what steps require standardization.

The result is leveraging your company's potential.

Financials

- ☐ Clearly define roles and tasks
- ☐ Easily generate financial reports
- ☐ Maintain best practice workflows

Project Management

- ☐ Define project structure
- ☐ Maintain and control project budgets
- ☐ Accurately capture time & expense on projects
- ☐ Analyze and report project profitability
